Chapter 1

SWAT

An upgraded SWAT 2012 revision 670 code

Objectives

- Standard indentation and translation to Fortran 90 by using `findent`. See the `translate-fortran90.pl` perl script file (:heavy_check_mark:)
- Exhaustive use of the "implicit none" directive to detect bad variable usage (:heavy_check_mark:)
- Generate a GNU `Make` makefile and compile with GNU `GFortran`. See the `generate-makefile.pl` perl script file (:heavy_check_mark:)
- Remove non-used variables and format labels (:heavy_check_mark:)
- Detect and solve all uninitialized variables (:heavy_check_mark: :construction:, some proposed solutions could be incorrect)
- Remove unneeded variable initializations (:heavy_check_mark:) as:

```
j=0 ! this line is not necessary  
j=ihru
```
- Remove redundant code (:heavy_check_mark:)
- Exhaustive use of the "parameter" directive on constants (:heavy_check_mark:)
- Remove global counters (as `i`, `ihru`, `iihru` or `idum` in module `parm`). Using local counters or passing values as argument are preferred (:construction:)
- Generate a detailed list of issues detected in the original code (:heavy_check_mark:, see at the end of this README)
- Remove obsolete commented code (:x:)
- Update variable descriptions in comments (:construction:, a lot of work)
- Standardize comments by using Doxygen style in order to generate documentation. See at `latex/refman.pdf` (:construction:, a lot of work)

Required tools

- `GFortran` (to compile the source code)
- `Make` (to build the executable file)
- `Perl` (optional: to execute the perl scripts to update the makefile or to translate original files to Fortran 90)
- `Findent` (optional: to translate original files to Fortran 90 with a standard indentation)
- `Doxygen` (optional: to generate a reference programming manual from source code)
- `TeX Live` or `MiKTeX` (optional: to generate a reference programming manual from source code)
- On Microsoft Windows systems you have to install `MSYS2` and the required utilities (`GFortran` and `Make`). You can follow detailed instructions in `install-unix`

Instructions to generate Fortran 90 style code from original code

In order to generate Fortran 90 style code with standard indentation from original code you have to type on a UNIX type terminal (you need `Perl` and `Findent`):

```
$ perl translate-fortran90.pl
```

Instructions to generate an initial GNU make Makefile

Type on the UNIX type terminal, when translated the original code to Fortran 90 style (you need `Perl`):

```
$ perl generate-makefile.pl
```

Instructions to generate an executable to test

Type on the UNIX type terminal (you need `GFortran` and `Make`)

- In UNIX type operative systems:

```
$ make
```

- In a `MSYS2` terminal in Microsoft Windows:

```
$ EXE=".exe" LDFLAGS="-static" make
```

- Cross-compiling a 32 bits Microsoft Windows executable in a UNIX type operative system:

```
$ prefix="i686-w64-mingw32-" EXE=".exe" LDFLAGS="-static" make
```

- Cross-compiling a 64 bits Microsoft Windows executable in a UNIX type operative system:

```
$ prefix="x86_64-w64-mingw32-" EXE=".exe" LDFLAGS="-static" make
```

Instructions to generate an optimized executable file

Type on the UNIX type terminal (you need **GFortran** and **Make**)

- In UNIX type operative systems:

```
$ CFLAGS="-march=native -flto" LDFLAGS="-flto" make strip
```

- In a **MSYS2** terminal in Microsoft Windows:

```
$ EXE=".exe" CFLAGS="-flto" LDFLAGS="-flto -static" make strip
```

- Cross-compiling a 32 bits Microsoft Windows executable in a UNIX type operative system:

```
$ prefix="i686-w64-mingw32-" EXE=".exe" CFLAGS="-flto" LDFLAGS="-flto -static" make strip
```

- Cross-compiling a 64 bits Microsoft Windows executable in a UNIX type operative system:

```
$ prefix="x86_64-w64-mingw32-" EXE=".exe" CFLAGS="-flto" LDFLAGS="-flto -static" make strip
```

Instructions to generate a reference programming manual from source code

Type on the UNIX type terminal (you need **Doxygen** and **TeX Live** or **MiKTeX**):

```
$ make latex/refman.pdf
```

The reference programming manual file latex/refman.pdf is generated from source code in PDF format

Issues in the original source code

This is a list of possible issues detected in the original source code. These issues have been mostly detected by the **GFortran** compiler warnings. Some of them could not arise because the logic of the variables is not possible.

- In biofilm.f:

- dcoef is used but not initialized. dcoef=3 as in watqual.f? Then, I propose at beginning: `real*8, parameter :: dcoef = 3.`

- In bmp_ri_pond.f:

- qseep and qet could be used not initialized at lines 133 and 134. However the problem only arises for `nstep<1`

- In bmp_sand_filter.f:

- sed_removed at line 342 could be used not initialized if `sfsedstdev<=0`

- In bpm_sed_pond.f:

- bmp_sed_pond seems to be bmp_sed_pond at line 186

- In bmp_wet_pond.f:

- hvol could be used not initialized in ext_dpth subroutine at line 267 in first bucle iteration

- In `clicon.f`:
