SWAT

An upgraded SWAT 2012 revision 670 code

Objectives

- Standard indentation and translation to Fortran 90 by using `findent`. See the translate-fortran90.pl perl script file (:heavy_check_mark:)
- Exhaustive use of the "implicit none" directive to detect bad variable usage (:heavy_check_mark:)
- Generate a GNU `Make` makefile and compile with GNU `GFortran`. See the gernerate-makefile.pl perl script file (:heavy_check_mark:)
- Remove non-used local variables and format labels (:heavy_check_mark:)
- Remove non-used global variables (:construction:)
- Detect and solve all uninitialized variables (:heavy_check_mark: :construction:, some proposed solutions could be incorrect)
- Remove unneeded variable initializations (:heavy_check_mark:) as:

  ```
  j=0 !  this line is not necessary
  j=ihru
  ```
- Remove redundant code (:heavy_check_mark:)
- Exhaustive use of the "parameter" directive on constants (:heavy_check_mark:)
- Remove global counters (as i, ihru, iihru, inum1 or idum in module parm). Using local counters or passing values as argument are preferred (:construction:)
- Generate a detailed list of issues detected in the original code (:heavy_check_mark:, see at the end of this README)
- Remove obsolete commented code (:x:)
- Update variable descriptions in comments (:construction:, a lot of work)
- Standardize comments by using Doxygen style in order to generate documentation. See at latex/refman.pdf (:heavy_check_mark:)

Required tools

Issues in the original source code

This is a list of possible issues detected in the original source code. These issues have been mostly detected by the GFortran compiler warnings. Some of them could not arise because the logic of the variables is not possible.

- In biofilm.f:
  - `dcoef` is used but not initialized. `dcoef=3` as in watqual.f? Then, I propose at beginning: `real*8, parameter :: dcoef = 3.`
- In bmp_ri_pond.f:
  - `qseep` and `qet` could be used not initialized at lines 133 and 134. However the problem only arises for `nstep<1`
- In bmp_sand_filter.f:
  - `sed_removed` at line 342 could be used not initialized if `sfsedstdev<=0`
- In bpm_sed_pond.f:
  - `bmp_sed _pond` seems to be `bmp_sed_pond` at line 186
- In bmp_wet_pond.f:
  - `hvol` could be used not initialized in `ext_dpth` subroutine at line 267 in first bucle iteration

- In depstor.f
  - itill is used at line 64 but not initialized in any part of code

  - nlayer could be used not initialized at line 23. However, the problem only arises if it is not set in the previous bucle (mlyr<=1 or sol_z(j1,j)<=0)
- In etact.f:
  - sev could be used not initialized at line 286 if dep>=esd and ly==2
- In filter.f:

- In grass_wway.f:
  - sf_depth and sf_sed could be used not initialized at lines 133 and 137 if sf_area>0 and sf↩_area<=1.e-6

- In killop.f:
  - ff1 and ff2 are used but not initialized at lines 167 and 267. They are set in harvkillop.f file (lines 257-258). They have to be included in modparm.f to share harvkillop.f values? or they have to be redefined as in harvkillop.f?

- In NCsed_leach.f90:
  - `perc_clyr` could be used not initialized at line 221 if `sol_nly(j)<2`

5.262 tillfactor.f90 File Reference

Functions/Subroutines

- subroutine tillfactor (j, bmix, emix, dtil, sol_thick)

  this procedure increases tillage factor (tillagef(l,j) per layer for each operation. The tillage factor settling will depend of soil moisture (tentatively) and must be called every day. For simplicity the settling is calculated now at the soil carbon sub because soil water content is available.

5.262.1 Detailed Description

file containing the subroutine tillfactor

5.262.2 Function/Subroutine Documentation

5.262.2.1 tillfactor()

```
subroutine tillfactor (
            integer, intent(in) j,
            real*8, intent(in) bmix,
            real*8, intent(inout) emix,
            real*8, intent(in) dtil,
            real*8, dimension(sol_nly(j)), intent(in) sol_thick )
```

this procedure increases tillage factor (tillagef(l,j) per layer for each operation. The tillage factor settling will depend of soil moisture (tentatively) and must be called every day. For simplicity the settling is calculated now at the soil carbon sub because soil water content is available.

Parameters

in	*j*	HRU number (none)
in	*bmix*	biological mixing efficiency: this number is zero for tillage operations (none)
in,out	*emix*	mixing efficiency (none)
in	*dtil*	depth of mixing (mm)
in	*sol_thick*	The tillage factor depends on the cumulative soil disturbance rating = csdr For simplicity, csdr is a function of emix. First step is to calculate "current" csdr by inverting tillage factor function. The effect of texture on tillage factor (ZZ) is removed first (and recovered at the end of the procedure). $$YY = tillagef(l,j)/ZZ$$ Since the tillage factor function is non linear, iterations are needed. $XX = 0.5$ is the initial value that works OK for the range of values observed. If a layer is only partially tilled then emix is corrected accordingly
