SWAT

An upgraded SWAT 2012 revision 670 code

Objectives

- Standard indentation and translation to Fortran 90 by using findent. See the translate-fortran90.pl perl script file (:heavy_check_mark:)
- Exhaustive use of the "implicit none" directive to detect bad variable usage (:heavy_check_mark:)
- Generate a GNU Make makefile and compile with GNU GFortran. See the gernerate-makefile.pl perl script file (:heavy_check_mark:)
- Remove non-used variables and format labels (:heavy_check_mark:)
- Detect and solve all uninitialized variables (:heavy_check_mark: :construction:, some proposed solutions could be incorrect)
- Remove unneeded variable initializations (:heavy_check_mark:) as:

```
j=0 ! this line is not necessary
j=ihru
```

- Remove redundant code (:heavy_check_mark:)
- Exhaustive use of the "parameter" directive on constants (:heavy_check_mark:)
- Remove global counters (as i, ihru, iihru or idum in module parm). Using local counters or passing values as argument are preferred (:construction:)
- Generate a detailed list of issues detected in the original code (:heavy_check_mark:, see at the end of this README)
- Remove obsolete commented code (:x:)
- Update variable descriptions in comments (:construction:, a lot of work)
- Standardize comments by using Doxygen style in order to generate documentation. See at latex/refman.pdf (:construction:, a lot of work)

Required tools

- GFortran (to compile the source code)
- · Make (to build the executable file)
- Perl (optional: to execute the perl scripts to update the makefile or to translate original files to Fortran 90)
- Findent (optional: to translate original files to Fortran 90 with a standard indentation)
- Doxygen (optional: to generate a reference programming manual from source code)
- Tex Live or MikTex (optional: to generate a reference programming manual from source code)
- On Microsoft Windows systems you have to install MSYS2 and the required utilities (GFortran and Make). You can follow detailed instructions in install-unix

Instructions to generate Fortran 90 style code from original code

In order to generate Fortran 90 style code with standard indentation from original code you have to type on a UNIX type terminal (you need Perl and Findent):

\$ perl translate-fortran90.pl

Instructions to generate an initial GNU make Makefile

Type on the UNIX type terminal, when translated the original code to Fortran 90 style (you need Perl):

\$ perl generate-makefile.pl

Instructions to generate an executable to test

Type on the UNIX type terminal (you need GFortran and Make)

· In UNIX type operative systems:

\$ make

• In a MSYS2 terminal in Microsoft Windows:

\$ EXE=".exe" LDFLAGS="-static" make

• Cross-compiling a 32 bits Microsoft Windows executable in a UNIX type operative system:

\$ prefix="i686-w64-mingw32-" EXE=".exe" LDFLAGS="-static" make

· Cross-compiling a 64 bits Microsoft Windows executable in a UNIX type operative system:

\$ prefix="x86_64-w64-mingw32-" EXE=".exe" LDFLAGS="-static" make

Instructions to generate an optimized executable file

Type on the UNIX type terminal (you need GFortran and Make)

· In UNIX type operative systems:

```
$ CFLAGS="-march=native -flto" LDFLAGS="-flto" make strip
```

• In a MSYS2 terminal in Microsoft Windows:

```
$ EXE=".exe" CFLAGS="-flto" LDFLAGS="-flto -static" make strip
```

• Cross-compiling a 32 bits Microsoft Windows executable in a UNIX type operative system:

```
$ prefix="i686-w64-mingw32-" EXE=".exe" CFLAGS="-flto" LDFLAGS="-flto -static" make strip
```

Cross-compiling a 64 bits Microsoft Windows executable in a UNIX type operative system:

```
$ prefix="x86\_64-w64-mingw32-" EXE=".exe" CFLAGS="-flto" LDFLAGS="-flto -static" make strip
```

Instructions to generate a reference programming manual from source code

Type on the UNIX type terminal (you need Doxygen and TeX Live or MiKTeX):

\$ make latex/refman.pdf

The reference programming manual file latex/refman.pdf is generated from source code in PDF format

Issues in the original source code

This is a list of possible issues detected in the original source code. These issues have been mostly detected by the GFortran compiler warnings. Some of them could not arise because the logic of the variables is not possible.

- In biofilm.f:
 - dcoef is used but not initialized. dcoef=3 as in watqual.f? Then, I propose at beginning: real*8, parameter :: dcoef = 3.
- In bmp_ri_pond.f:
 - qseep and qet could be used not initialized at lines 133 and 134. However the problem only arises for nstep<1
- In bmp_sand_filter.f:
 - sed_removed at line 342 could be used not initialized if sfsedstdev<=0</p>
- In bpm_sed_pond.f:
 - bmp_sed _pond seems to be bmp_sed_pond at line 186

7.7 atri.f90 File Reference 109

7.6.2.1 ascrv()

```
subroutine ascrv (
    real*8, intent(in) x1,
    real*8, intent(in) x2,
    real*8, intent(in) x3,
    real*8, intent(in) x4,
    real*8, intent(out) x5,
    real*8, intent(out) x6)
```

this subroutine computes shape parameters x5 and x6 for the S curve equation

$$x = \frac{y}{y + \exp(x5 + x6y)}$$

given 2 (x,y) points along the curve. x5 is determined by solving the equation with x and y values measured around the midpoint of the curve (approx. 50% of the maximum value for x) and x6 is determined by solving the equation with x and y values measured close to one of the endpoints of the curve (100% of the maximum value for x). This subroutine is called from readbsn.f90 and readplant.f90

Parameters

in	х1	value for x in the above equation for first datapoint, x1 should be close to 0.5 (the midpoint of the curve)
in	x2	value for x in the above equation for second datapoint, x2 should be close to 0.0 or 1.0
in	хЗ	value for y in the above equation corresponding to x1
in	x4	value for y in the above equation corresponding to x2
out	x5	1st shape parameter for S curve equation characterizing the midpoint of the curve
out	х6	2nd shape parameter for S curve equation characterizing the regions close to the endpoints of
		the curve

Functions/Subroutines

• subroutine tillfactor (j, bmix, emix, dtil, sol_thick)

this procedure increases tillage factor (tillagef(l,j) per layer for each operation. The tillage factor settling will depend of soil moisture (tentatively) and must be called every day. For simplicity the settling is calculated now at the soil carbon sub because soil water content is available.

subroutine tillfactor (
    integer, intent(in) j,
    real*8, intent(in) bmix,
    real*8, intent(inout) emix,
    real*8, intent(in) dtil,
    real*8, dimension(sol_nly(j)), intent(in) sol_thick)
```

this procedure increases tillage factor (tillagef(I,j) per layer for each operation. The tillage factor settling will depend of soil moisture (tentatively) and must be called every day. For simplicity the settling is calculated now at the soil carbon sub because soil water content is available.

Parameters

in	j	HRU number (none)
in	bmix	biological mixing efficiency: this number is zero for tillage operations (none)
in,out	emix	mixing efficiency (none)
in	dtil	depth of mixing (mm)
in	sol_thick	The tillage factor depends on the cumulative soil disturbance rating = csdr For simplicity, csdr is a function of emix. First step is to calculate "current" csdr by inverting tillage factor function. The effect of texture on tillage factor (ZZ) is removed first (and recovered at the end of the procedure).
		YY = tillagef(l, j)/ZZ
		Since the tillage factor function is non linear, iterations are needed. $XX=0.5$ is the initial value that works OK for the range of values observed. If a layer is only partially tilled then emix is corrected accordingly

7.204.2.1 ysed()

```
subroutine ysed (
                integer, intent(in) iwave,
                integer, intent(in) j )
```

this subroutine predicts daily soil loss caused by water erosion using the modified universal soil loss equation

Parameters

in	iwave	flag to differentiate calculation of HRU and subbasin sediment calculation (none) iwave = 0 for HRU iwave = subbasin # for subbasin
in	j	HRU number
